Understanding Basic Concepts in Nuclear Chemistry

Before diving into problem-solving, it's important to grasp foundational principles that underpin nuclear chemistry.

The Structure of the Atom and Nucleus

- Protons and neutrons make up the nucleus, held together by nuclear forces.
- The number of protons defines the element (atomic number), while neutrons can vary, creating isotopes.
- Electrons orbit the nucleus and determine chemical properties but are less involved in nuclear reactions.

Radioactivity and Types of Decay

- Radioactive decay is the spontaneous emission of particles or energy from unstable nuclei.
- Common decay types include alpha decay, beta decay, gamma decay, and positron emission.
- Each decay type involves different particles and energy changes, critical for solving problems.

Half-Life and Radioactive Decay Law

- The half-life ($t_{1/2}$) is the time it takes for half of a radioactive sample to decay.

- The decay law relates remaining quantity (N) to initial amount (N_0), decay constant (λ), and time (t): $N = N_0 e^{-\lambda t}$.
- Understanding how to manipulate and apply these formulas is key in problem-solving.

Common Types of Nuclear Chemistry Problems and Solutions

Here we explore typical problems encountered in nuclear chemistry, along with step-by-step solutions to enhance understanding.

1. Calculating Remaining Radioactive Material After a Certain Time

Problem Example: A sample of uranium-235 has an initial mass of 100 grams. If the half-life of U-235 is 703.8 million years, how much remains after 1 billion years?

Solution Steps:

- Identify knowns:
 - Initial mass, $N_0 = 100$ g
 - Half-life, $t_{1/2} = 703.8$ million years
 - Time elapsed, $t = 1$ billion years
- Calculate the number of half-lives elapsed:
 - Number of half-lives, $n = t / t_{1/2} = 1,000 / 703.8 \approx 1.42$
- Determine remaining amount:
 - Remaining mass = $N_0 \times (1/2)^n = 100 \times (1/2)^{1.42} \approx 100 \times 0.36 \approx 36$ grams

Answer: Approximately 36 grams of uranium-235 remain after 1 billion years.

2. Decay Constant and Half-Life Relationship

Problem Example: If a sample has a decay constant (λ) of 0.001 per year, what is its half-life?

Solution Steps:

- Recall the relationship: $t_{1/2} = \ln(2) / \lambda$
- Calculate:
- $t_{1/2} = 0.693 / 0.001 \lambda = 693 \text{ years}$

Answer: The half-life of the sample is approximately 693 years.

3. Balancing Nuclear Reactions

Problem Example: Balance the alpha decay of uranium-238:

Solution Steps:

- Determine the change in atomic number:
- Uranium atomic number = 92
- Alpha particle atomic number = 2
- The atomic number decreases by 2, so the daughter nucleus has atomic number 90.
- Mass number decreases by 4, so the daughter nucleus has a mass number of 234.
- Write the balanced equation: $^{238}\text{U} \rightarrow ^{234}\text{Th} + ^4\text{He}$

Answer: The decay produces thorium-234 and an alpha particle.

4. Calculating Activity of a Radioactive Sample

Problem Example: A 50-gram sample of radon-222 has a decay constant of 4.45×10^{-6} per second. What is its activity (in disintegrations per second)?

Solution Steps:

- Use the formula:
- Activity (A) = $\lambda \times N$
- Calculate the number of atoms, N:
- $N = (\text{mass} / \text{molar mass}) \times \text{Avogadro's number}$

- $N = (50 \text{ g} / 222 \text{ g/mol}) \times 6.022 \times 10^{23} \approx 1.35 \times 10^{23} \text{ atoms}$
- Calculate activity:
- $A = 4.45 \times 10^{-6} \times 1.35 \times 10^{23} \approx 6.01 \times 10^{17} \text{ disintegrations/sec}$

Answer: The activity of the radon sample is approximately 6.01×10^{17} disintegrations per second.

$$N = n \times N_A = 0.004255 \text{ mol} \times 6.022 \times 10^{23} \text{ atoms/mol} \approx 2.56 \times 10^{21} \text{ atoms}$$

\]

- Calculate total reactions:

- Each atom undergoing fission releases energy proportional to the mass defect.
- Total reactions: approximately equal to the number of atoms, assuming complete fission.

- Calculate energy per reaction:

\[

$$E_{\text{reaction}} = 0.2 \text{ u} \times 931.5 \text{ MeV/u} = 186.3 \text{ MeV}$$
