

LECTURES ON URBAN ECONOMICS EXERCISE ANSWERS Full Version

Lectures on Urban Economics Exercise Answers

Urban economics is a vital field that explores the economic dynamics within cities, including land use, housing, transportation, and local policies. For students and practitioners alike, engaging with exercises and problem sets from urban economics lectures is essential to deepen understanding and apply theoretical concepts to real-world scenarios. In this comprehensive guide, we will explore common types of exercises encountered in urban economics courses and provide detailed answers and explanations to enhance your learning experience.

Understanding the Fundamentals of Urban Economics Exercises

Urban economics exercises typically cover core topics such as land rent and land use, housing markets, transportation costs, congestion pricing, and local government policies. These exercises are designed to test conceptual understanding, analytical skills, and the ability to apply economic models to urban contexts.

Key objectives include:

- Analyzing land rent gradients
- Calculating housing prices and rent differentials
- Evaluating transportation and congestion externalities
- Assessing policy impacts on urban development

By mastering these exercises, students develop a robust understanding of how economic principles shape city growth and structure.

Common Types of Urban Economics Exercises and Model Answers

In this section, we will address several typical exercise types, providing detailed solutions and explanations.

1. Land Rent Gradient Calculation

Exercise:

Suppose the city center is the initial point of reference for land rent, and land rent decreases with distance from the center. The rent at the city center is \$1,000 per acre, and it declines at a rate of \$50 per mile. What is the land rent at 4 miles from the city center?

Answer:

To calculate rent at a given distance, use the linear rent gradient formula:

Rent at distance (d) = Rent at center - (decline rate $\times$ distance)

Applying the values:

Rent at 4 miles = \$1,000 - (\$50 $\times$ 4) = \$1,000 - \$200 = \$800

Explanation:

This simple model assumes a linear decline, which is common in urban economics to illustrate how land value diminishes as you move away from the central business district (CBD). Understanding this gradient helps explain land use patterns and property values.

2. Housing Price and Rent Differentials

Exercise:

A housing unit located 3 miles from the city center has a market rent of \$1,200 per month. The annualized land rent gradient indicates a decrease of \$150 per mile from the city center. Assuming a homeowner's housing consumption is valued at \$15,000 per year and the annual rent is a proxy for housing service value, what should be the maximum price a buyer is willing to pay for this property?

Answer:

First, estimate the land rent at 3 miles:

Land rent at 3 miles = \$1,000 - (\$150 $\times$ 3) = \$1,000 - \$450 = \$550

Next, determine the total annual housing service value:

Housing value = \$15,000 per year

The maximum price is roughly the present value of the annual housing service, considering the land

rent and maintenance costs. Ignoring discounting for simplicity, the buyer would consider:

Maximum price ? Housing value - (Land rent + other costs)

Assuming other costs are negligible, the maximum price:

? $\$15,000 - \$550 = \$14,450$

Explanation:

This exercise demonstrates how land rent gradients affect property values and buyers' willingness to pay, emphasizing the importance of location in real estate valuation.

3. Transportation Costs and Urban Sprawl

Exercise:

A city considers implementing a congestion charge of \$10 per trip during peak hours. The average trip length is 5 miles, and the average vehicle operates at 20 miles per gallon, with gasoline costing \$4 per gallon. What is the increase in transportation cost per trip due to congestion pricing? How might this influence urban sprawl?

Answer:

Calculate the additional cost:

Congestion charge per trip = \$10

Fuel cost per mile:

Fuel per mile = $\$4 / 20 \text{ miles} = \0.20 per mile

Fuel cost per trip:

= $5 \text{ miles} \times \$0.20 = \1

Total increase in transportation cost:

= $\$10 \text{ (congestion charge)} + \$1 \text{ (fuel)} = \$11$

Implications:

- The additional \$11 per trip may discourage travel to central areas during peak hours, incentivizing the development of suburban areas with less congestion.
- Higher transportation costs can lead to urban sprawl as residents seek affordable land farther from city centers.
- Policymakers might use congestion pricing to manage traffic and influence urban form.

4. Zoning and Land Use Restrictions

Exercise:

Suppose a city enforces strict zoning laws that limit residential development in the downtown area, leading to higher housing prices in the suburbs. How does this restriction influence land rent and urban density?

Answer:

Impact on land rent:

- Restrictive zoning limits supply in the downtown area, increasing land scarcity.
- Scarcity drives up land rents close to the city center, making central land more expensive.

Impact on urban density:

- Higher land prices encourage vertical development (apartment buildings) to maximize land use.
- In suburban areas, less restrictive zoning allows for more extensive development, potentially reducing density.

Overall effect:

- Restrictive zoning increases economic rent in central areas, possibly leading to increased commuting and longer travel times.
- It can also contribute to urban sprawl if suburban zones are less regulated.

Strategies for Approaching Urban Economics Exercises

To excel in urban economics exercises, consider the following strategies:

- **Understand the Models:** Grasp key models such as the Alonso monocentric city model, bid-rent curve, and transportation externalities.
