Question What are the main functions of the human skeletal system? The human skeletal system provides support and structure to the body, protects internal organs, facilitates movement by serving as attachment points for muscles, stores minerals like calcium and phosphorus, and produces blood cells in the bone marrow. How does the cardiovascular system work to circulate blood throughout the body? The cardiovascular system consists of the heart, blood, and blood vessels. The heart pumps oxygenated blood from the lungs to the body tissues and returns deoxygenated blood to the lungs for oxygenation. This continuous circulation supplies nutrients and oxygen while removing waste products. What is the role of the respiratory system in maintaining homeostasis? The respiratory system maintains homeostasis by facilitating gas exchange?delivering oxygen to the blood and removing carbon dioxide. It also helps regulate blood pH and supports vocalization and smell. Describe the process of muscle contraction at the cellular level. Muscle contraction occurs when the nervous system stimulates muscle fibers via motor neurons. Calcium ions are released inside muscle cells, enabling the interaction between actin and myosin filaments, which slide past each other to produce contraction through the cross-bridge cycle. Why is the endocrine system important for maintaining physiological balance? The endocrine system secretes hormones that regulate various bodily functions such as growth, metabolism, reproduction, and mood. It works closely with the nervous system to maintain homeostasis and respond to internal and external stimuli.
